1. Lin, J.-R., Hu, Z.-Z., Zhang, J.-P., & Yu, F.-Q. (Yıl). *A natural-language-based approach to intelligent data retrieval and representation for cloud BIM*.

The text examines the data retrieval for BIM. They integrated IFC libraries into NLP to understand unstructured texts. So that data can be understood as an IFC object.

This situation stems from the following: When humans make a query, it is necessitated by the computational challenge of loading entire files. Consequently, data is reformatted and indexed in a dedicated storage environment to optimize retrieval performance.

These questions occurred to me: How does the system interpret unstructured texts that do not have a direct corresponding entity in the IFC schema? If so, does the lack of a direct mapping between natural language and IFC classes lead to inaccuracies or data misinterpretation during the conversion process? Should an additional processing layer have been implemented to better categorize and parse unstructured text before integrating it into the BIM environment?

In my opinion, while the integration of IFC libraries into NLP marks a significant step toward intelligent BIM data retrieval, the system's handling of unstructured text remains a critical point of concern. Therefore, I believe that implementing an additional layer of linguistic analysis, specifically focused on unstructured text, would have been a more robust approach to ensuring data integrity before mapping it into the BIM environment.
