

1. Kitchen, C. & Lauriault, T.P. (2017). Toward Critical Data Studies Charting and Unpacking Data Assemblages and Their Work.

The text examines the data and database. It addresses the security aspect of databases. Databases classify human behaviour, and algorithms make inferences about us. Authors claim that data secretly controls our lives. The system tracks you through cross-databases.

This situation leads to the following: What are these databases used for, and what purpose should they serve? Will data used for security purposes today be used for threats tomorrow?

In my opinion, data should be a matter for every individual. Ultimately, as big data continues to expand its reach, reclaiming individual agency over personal information is essential to resist unchecked digital profiling. Without strict data minimization and privacy by design, the tools meant to protect society will inevitably be turned against the very citizens they are supposed to serve.
