

Papers:

- 1- Making Local Data Memoirs: Changing Orientations in Relation to Environmental Concerns
- 2- Taking Big Data apart: local readings of composite media collections, Yanni Alexander Loukissas

The text addresses the question of how data is connected to local contexts. They claim that data is never a universal or objective source of truth; rather, all data is "local". We must actively engage with its specific origins, physical contexts, and emotional (Janicki et al., 2025) qualities to truly understand what data does to us experientially.

These papers approach the topic by introducing localized methodologies such as local data memoirs and local readings.

In my opinion, reading these texts together highlights a crucial paradigm shift: whether we are dealing with global Big Data or local data, data should not be treated merely as instrumental facts, but rather as subjective devices that require critical, contextual, and human analysis to prevent disorientation and misuse.
